U.S. Serial No. 10/282,010

Inventor: Mehail Page 2 of 11

IN THE CLAIMS:

1. (Currently Amended) A method of making electricity and recovering the compression energy in an engine comprising:

supplying compressed natural gas from a high pressure main line to a combustion chamber;

supplying compressed air from a high pressure air vessel to the combustion chamber from the high-pressure air vessel;

burning said fuel and air in said combustion chamber to form a compressed combustion gas;

opening an intake valve and supplying said compressed combustion gas to a positive displacement chamber containing a reciprocating piston such that said compressed combustion gas expands forcing said piston in a direction that increases the volume of the positive displacement cylinder to form an expanded gas;

closing said intake valve and opening an exhaust valve and allowing the expanded gas to exit said displacement chamber while said piston is moving in a direction which decreases the volume of the positive displacement chamber to provide a exhaust gas ad and thereby produce rotational energy; and

driving an electrical generator with said rotational energy to produce electricity.

2. (Currently Amended) A method according to claim 1, further comprising the steps of making electricity and recovering the compression energy in an engine comprising:

supplying compressed natural gas from the high pressure main line to a high pressure gas vessel and supplying compressed natural gas from the high pressure gas vessel to the a combustion chamber;

supplying compressed air from a high pressure air vessel to the combustion chamber from the high-pressure air vessel;

burning said fuel and air in said combustion chamber to form a compressed combustion gas;

opening an intake valve and supplying said compressed combustion gas to a positive displacement chamber containing a reciprocating piston such that said compressed combustion gas expands forcing said piston in a direction that increases the volume of the positive displacement cylinder to form an expanded gas;

closing said intake valve and opening an exhaust valve and allowing the expanded gas to exit said displacement chamber while said piston is moving in a direction which decreases the volume of the positive displacement chamber to provide a exhaust gas and thereby produce rotational energy; and

driving an electrical generator with said rotational energy to produce electricity.

- 3. Canceled.
- 4. (Original) A method according to claim 1, further comprising the step of driving an air compressor with the rotational energy to produce compressed air in said high pressure air vessel.
- 5. (Currently Amended) A method according to claim 1, further comprising the step of making electricity and recovering the compression energy in an engine comprising:

supplying compressed natural gas from a high pressure main line to a combustion chamber;

driving an air compressor with the compression energy of natural gas from said main line to produce compressed air in said high pressure air vessel;

supplying compressed air from a high pressure air vessel to the combustion chamber from the high-pressure air vessel;

burning said fuel and air in said combustion chamber to form a compressed combustion gas;

opening an intake valve and supplying said compressed combustion gas to a positive displacement chamber containing a reciprocating piston such that said compressed combustion gas expands forcing said piston in a direction that increases the

volume of the positive displacement cylinder to form an expanded gas;

closing said intake valve and opening an exhaust valve and allowing the expanded gas to exit said displacement chamber while said piston is moving in a direction which decreases the volume of the positive displacement chamber to provide a exhaust gas ad and thereby produce rotational energy; and

driving an electrical generator with said rotational energy to produce electricity.

- 6. (Original) A method according to claim 2, further comprising filling the high-pressure fuel and air vessels to at least about 2000 pounds per square inch.
- 7. (Original) A method according to claim 2, further comprising filling the high-pressure fuel and air vessels to at least about 3000 pounds per square inch.
- 8. (Original) A method according to claim 2, further comprising filling the high-pressure fuel and air vessels to at least about 3500 pounds per square inch.
- 9. (New) A method according to claim 5, further comprising filling the high-pressure fuel and air vessels to at least about 2000 pounds per square inch.
- 10. (New) A method according to claim 5, further comprising filling the high-pressure fuel and air vessels to at least about 3000 pounds per square inch.
- 11. (New) A method according to claim 5, further comprising filling the high-pressure fuel and air vessels to at least about 3500 pounds per square inch.
